Business Recommendations

- Horror demonstrated the highest average ROI at approximately **83.26%**.
- Budget has a strong positive relationship with revenue (**0.76 correlation**), but higher spending does not guarantee success.
- Popularity has almost no correlation with revenue (**0.014**).
- Vote average has almost no correlation with revenue (**-0.005**).
- Revenue prediction can be used as an initial planning estimate, but not as a guaranteed outcome.
- The success classifier should be interpreted cautiously because it has limited ability to identify unsuccessful movies.

Note: The success model defines success as Revenue > Budget. Revenue-derived variables were excluded from the predictive features to avoid data leakage.
